

Terra

What It Is

Terra is a modern world generation modding platform, primarily for Minecraft. Terra allows complete customization of world generation with an advanced API, tightly integrated with a powerful configuration system.

<https://terra.polydev.org/index.html>

Useful Commands

Terra is actually used through other plugins, especially Multiverse Core.

Config Packs

Terra is a framework for generating Minecraft worlds. In order to actually generate a world, you need a config pack. By default, Terra comes with one called Overworld, but there's plenty of others available. Currently installed on this server are:

Overworld

The default overworld configuration for Terra 6.0+, containing over 140 different biomes.

<https://github.com/PolyhedralDev/TerraOverworldConfig>

Aeropelago

A Terra config pack themed around floating islands.

<https://github.com/astrsh/Aeropelago>

Substratum

A Terra pack that creates a completely underground world with several unique caves to explore within.

Origen

Origen focuses on adding a new and more creative / diverse terrain generation, without using any new blocks or items. This means that it is compatible with vanilla installations.
